

# Unify OpenScape UC Application

## Atos Unify OpenScape UC Application V10

Highly open and flexible Unified Communications solution that integrates with all your existing applications

OpenScape UC Application is a highly open Unified Communications solution for enterprises that need an extremely flexible solution.

It increases team performance through seamless, intuitive, and efficient collaboration and increasing staff productivity.

OpenScape UC Application is based on the Services Oriented Architecture (SOA) and therefore easily integrates itself in different IT and telephony environments as well as in legacy-based Microsoft or HCL (IBM) applications.

Additionally, for enterprises that would like the benefits of transformational process efficiencies offered by Communications Embedded Business Processes (CEBP), this is the application that seamlessly integrates other business applications and social networks.

OpenScape UC Application gives the following benefits to organizations:

- Integrated audio, web, and video conferencing enables them to enhance collaboration and increase team productivity while at the same time minimizing costs for 3rd-party conferencing services, the need to travel, and rental costs.
- OpenScape UC Application provides workers and teams with a convenient method for collaborating ad-hoc and in real-time, which results in faster action and decision-making.
- Continuous availability and productivity for mobile and remote workers through presence-based real-time communication

- Improved and speeded-up processes through communication functions accessible directly in the applications used by workers
- Utilization and optimization of existing applications through seamless integration in an open, standards-based UC solution

### Features and capabilities

#### Fast access to key people

Presence technology enables users to view the availability and status of key contacts. It provides users with "presence status" information about a contact's availability, before they communicate, enabling them to choose the best method and time to communicate effectively on the first attempt. Users manage their own presence status, and decide for whom they are available, at what times, under which circumstances, and over which media and device of choice.

For very large organizations, rich presence is also available between two or more OpenScape UC Application systems or domains, enabling users to view the presence status of all OpenScape users across the network.

With Federated Presence these capabilities are extended beyond your organization, to the community of people who work outside the walls of your office. In a federated network, OpenScape users can share their user and IM presence availability and exchange instant messages with people outside your organization who are using any XMPP-capable UC solution.

#### Instant Messaging (Chat)

Instant Messaging (IM) allows text messages to be sent to other OpenScape UC Application users. Emoticons and hyperlinks are also supported.

The IM presence control occurs in the new client and in Atos Unify OpenScape Fusion in the background during login/logout. Also supported is the storage of chat messages (chat history).

With OpenScape UC Application V10, users can attach files to chat messages like pictures, screen shots, text, etc. The storage of chat messages (chat history) is limited by default.

Since OpenScape UC Application uses the standard XMPP protocol for its internal IM implementation, it is also possible to support any non-UC XMPP-based IM solution. However, those implementations must always be done on a project specific base and need additional support from our Professional Services organization.

#### Organizing and communicating with contacts

OpenScape UC users can create a personal contact list, which provides quick click-to-call, IM, or e-mail access to colleagues. This also applies to people outside your organization whom you communicate with frequently.

Contacts can also be called directly from search results or from the journal.

Once a telephone connection is established, additional features such as alternate, consultation, callback or conference are available.

The new WebClient gives the following options for administration of contacts:

- Profile pictures can be integrated for personal contacts as well as for contacts found from directory search.
- The contact search, journal, and voice mails (device & user presence) feature display of availability.
- The "Contextual Action Bar" can save contacts at any time of the application, e.g., from searches, favorites/groups, journal, voice mail, conferences, to perform further actions with these contacts (e.g. to add to a contact group).

## Being reached from your single published phone number

Regardless of where you are, you can always be reached via your single published phone number. Using One Number Service (ONS), OpenScape UC routes all your calls to your preferred device. You decide which telephone you would like to use for your communications, such as your office phone, mobile phone, home phone, or even a conference room.

## Conferencing and teamwork

OpenScape UC's audio, web, and video conferencing enhance internal as well as external collaboration and increase team productivity, while minimizing 3rd-party conferencing services and travel costs.

With just a few clicks, users can initiate planned or spontaneous voice, web, or video conferencing sessions. By using presence information, employees can instantly see whether a colleague is available, allowing spontaneous, easily initiated conferencing sessions. This provides employees with a convenient way to instantly collaborate in real-time, reaching the most available people, to facilitate faster action and decision-making.

Conferencing features include:

- Integrated voice, web, and multi-party video conferencing
- Setup of schedule conferences, with or without a moderator
- Transfer of moderation between participants
- Multiple moderators are possible
- Avatars
- Ad-hoc conferencing
- "Meet-Me" conferences with dial-in access for guests using a PIN
- "Meet-You" conferences to have participants be called directly
- In "Meet-You" conferences, participants are called when the moderator enters; thus avoiding unnecessary waiting.

- Adding/removing conference participants with a mouse click
- Display of speaking participant
- Muting of individual participants or all participants in a conference
- Locking the conference for security and privacy
- Disconnecting individual participants from the conference or ending the conference call entirely

Due to the introduction of WebRTC technology, guests can now also participate in UC conferences using a supported browser.

- The e-mail conference invitation now contains a browser link in addition to the telephone dial-up. This allows you to take part in a UC conference with a simple click, directly from the computer, using a supported browser
- Audio and video are supported
- "Dialing in with a phone number and PIN is optional

The "Team" features allow OpenScape UC Application users to be combined into individual teams.

Every team member can:

- see the telephone status of other members in the same team
- receive notifications of incoming calls for other members of the same team
- accept incoming calls for other members of the same team

Every user may individually define whether calls are displayed to other team members.

Groups features include:

- Groups can be custom-configured
- An overview of presence information is available at all times
- "One Click to Communicate": A conference, instant messaging, etc. can be started with only one click

## Integration

What makes OpenScape UC Application so attractive to many of our customers, is its ability to integrate with any other part of their communications system.

That's because we built OpenScape UC Application using industry standards such as Services Oriented Architecture, which provides easy integration into your favorite groupware solutions such as Microsoft Office 365 or Office 2016.

This enables your teams to seamlessly and spontaneously access key people and

information without having to switch applications, or to search endlessly in databases or directories.

Perhaps your teams use Microsoft Office as one of their primary communications tools? No problem. We can interconnect OpenScape Fusion with your Outlook as well as with your Skype for Business / Lync client so that all communications and collaboration can be directly initiated from within your preferred user interface (e.g. via vCard in Microsoft Office).

## Atos Unify OpenScape Desktop Videoconferencing

OpenScape Desktop Videoconferencing allows you to schedule video conferences and easily launch the conference with a mouse click within the OpenScape UC softphone window. OpenScape's videoconferencing provides Continuous Presence video views or Voice Activating Switching, so that all participants in the video call can be seen on screen at the same time - and everyone can see who is speaking because the speaker is shown with a larger picture. Any user with a standard desktop video camera or webcam can easily initiate or join video conferences right from their OpenScape desktop client or web client with browser softphone (via WebRTC). OpenScape Desktop Videoconferencing also interoperates with conference room solutions and video phones from leading manufacturers.

In particular, the following benefits are provided:

- Full HD resolution with video room systems integrated directly without a gateway and extra costs
- HD resolution with OpenScape desktop clients
- Seamless scheduling of all conferencing services (only one dial-in for audio)
- High security standards
- Hide / display of participant names, also for audio participants

## Rules and routing

All employees can customize their individual routing rules to organize their personal communications effectively. Routing rules can be defined and prioritized by a variety of factors such as caller priority levels, current presence status and time of day / weekday.

## Call journal

Incoming and outgoing calls are logged in a personal call journal. Employees can immediately view an overview of missed calls and can respond accordingly.

Selectable filters help simplify sorting or finding individual journal entries.

## Directory search

OpenScape UC can be connected to different enterprise directories, including an unlimited number of LDAP directories.

Via a directory search that can also include personal contacts and Microsoft Outlook contacts, employees can quickly access other people.

## Mobile employees

The Atos Unify OpenScape UC Mobile Client provides additional convenience, flexibility, and efficiency for highly mobile workers. The Mobile Client software is available in three modes. It can run in "UC-only" mode, "VoIP-only" mode, or combined UC and VoIP mode. The "UC-only" mode is included with each OpenScape UC user license. Mobile UC Client users can benefit from presence awareness of key contacts, quick access to conferences, setting their presence status and preferred device, among many other OpenScape UC features. Furthermore, audio as well as video calls can be initiated from cell phones and tablets (with Apple iOS or Android) with OpenScape Mobile Client (OS-MO). The Mobile UC Client runs on the most popular operating systems including those from Apple, Android, Blackberry, and Windows.

The DTMF and speech-enabled voice portal provides access to features from any phone while away from the desk and allows users to retrieve and process e-mail and voice messages from a single unified voice mailbox. The voice portal supports Natural Language Understanding (NLU) which enables you to talk to the system as you would talk to another human being without having to follow or wait for prompts.

## Atos Unify OpenScape Web Collaboration

The web conferencing feature of OpenScape UC provides scalable, reliable, and highly secure web conferencing capabilities. It provides a cost effective and efficient way to deliver meetings with up to 1,000 session participants who can be both internal and external participants. A conference can be created together with audio as well as video in OpenScape UC clients. Key features include:

- Desktop sharing
- Desktop video support
- Whiteboard
- Locking the conference

- File board for documents
- Multi monitor support
- Selection of contents to be shared
- Can be started by the initiator as well as invitees
- Secure data transmission (256-bit AES)
- Manipulation-proof recording function for the web conference

For more information, read the OpenScape Web Collaboration data sheet.

## Executive/Assistant communications

Atos Unify OpenScape's Executive/Assistant feature is an XML application that can be used to display OpenScape UC Presence status changes, device status, and telephone events on the CP phone display. This feature is ideal in an executive/assistant environment where assistants need up-to-date status information on the activities of the executive's phone.

## Atos Unify OpenScape Interactive Voice Response (IVR) applications

For simple IVR configurations, incoming calls can be forwarded and processed automatically by using the intuitive, web-based Atos Unify OpenScape Auto Attendant. For more customized interactive voice and speech applications, the easy drag & drop graphical OpenScape Fusion Application Builder can be used.

The solution permits operation as a classic IVR application, by UC functions, or use with Atos Unify OpenScape Contact Center.

Very large directories can also be managed when it is used as a voice-based attendant service (Auto Attendant).

## OpenScape UC is open

OpenScape UC implements powerful multimedia communication functions via the media-independent Session Initiation Protocol (SIP), offering stability, speed, and high scalability.

## Client access options

OpenScape users can choose between several different clients: the Microsoft Windows-based OpenScape Fusion for Office Client, the Web Client for use with browsers, the Mobile Client, and the speech-enabled Voice Portal. When integrated with Microsoft Exchange, users can communicate from within their groupware client and listen to their e-mails from the Voice Portal.

The OpenScape Fusion for Office Client also includes softphone functionality based on SIP.

By design, OpenScape UC Application is based on an open architecture. The OpenScape Fusion Software Developers Toolkit (SDK) allows customers and developer partners to embed OpenScape UC capabilities within the business applications used by the enterprise, such as presence information or click-to-call/conference functions.

OpenScape Fusion clients are included with each OpenScape UC user license. It provide easy-to-deploy pre-built integrations to the e-mail and calendar applications of Microsoft Outlook and HCL (IBM) Notes as well as Microsoft Lync and Skype for Business.

## Interfaces

- Instant Messaging: OpenFire over XMPP
- Directory Access: via LDAP
- Groupware: Microsoft Exchange 2010 and Microsoft Exchange 2013 via Web Services and Exchange Online
- Microsoft Lync over UCMA V5
- Microsoft Outlook 2010/2013/2016 via Microsoft Outlook SDK
- Video: via H.264 (AVC)

## Languages

- German
- English (UK) - user interface: international English, greetings: English (UK)
- English (US) - user interface: international English, greetings: English (US)
- Chinese (Mandarin)
- Italian
- Spanish
- French
- Portuguese
- Brazilian Portuguese

Note: The OpenScape Fusion clients are supported in German and international English.

## System capacities

### Integrated deployment

- OpenScape Voice and OpenScape UC Application on one server
- Up to 1,250 users

### Small deployment

- All OpenScape UC Application central components are stored on a single centralized computer system.
- Up to 2,500 users

### Large deployment

- The OpenScape Backend Service and CMP from the OpenScape UC Application central components are stored on a single centralized computer system.
- Up to 15,000 users

### Very large deployment

- Up to 35,000 users per cluster

- Maximum number of clusters: 5 (for more than 5 clusters, a project-specific release is required)
- Support for up to 40,000 users per cluster with mobile devices
- MySQL DBMS is used for very large deployments

### Virtualization

In a virtualized server environment, where more than one OpenScape application resides on the same server, the maximum number of users in a small deployment is 2,500 users, in a large deployment is 15,000 users, and in a very large deployment is 35,000 users (per cluster).

## Supported communication platforms

- OpenScape Voice V9
- OpenScape Voice V10
- OpenScape 4000 V7
- OpenScape 4000 V8

Note: Not all features are supported equally on all platforms.

## Software platforms

### OpenScape Web Client

- Microsoft Internet Explorer V11 and Edge
- Mozilla Firefox
- Apple Safari
- Google Chrome (supports WebRTC)

### OpenScape UC Mobile Client

- iPhone
- Android

See also: Documentation for OpenScape Mobile Client (OSMO)

### Executive/Assistant Client

- Desk Phone CP400 / CP600 / CP600E

### Server

- SUSE Linux Enterprise Server V12 64 Bit
